Course Name: Ethical Hacking

Faculty Name: Prof. Indranil Sen Gupta

Department : Computer Science and Engineering

Topic

Lecture 1: Introduction to Ethical Hacking

CONCEPTS COVERED

- What is ethical hacking?
- Penetration testing
- Role of the ethical hacker

What is Ethical Hacking?

- It refers to the act of locating weaknesses and vulnerabilities of computer and information systems by replicating the intent and actions of malicious hackers.
- It is also known as *penetration testing*, *intrusion testing* or *red teaming*.

Introduction to Ethical Hacking

- **Ethical Hackers**
  - Employed by companies to perform penetration test.
- **Penetration Test**
  - Legal attempt to break into the company's network to find the weak links.
  - Tester only report findings, does not provide solutions.
- **Security Test**
  - Also includes analyzing company's security policy and procedures.
  - Tester offers solutions to secure or protect the network.

Some Terminologies

- **Hacking** - showing computer expertise.
- **Cracking** - breaching security on software or systems.
- **Spoofing** - faking the originating IP address in a datagram.
- **Denial of Service (DoS)** - flooding a host with sufficient network traffic so that it cannot respond anymore.
- **Port Scanning** - searching for vulnerabilities.

Gaining access

- **Front door**
  - Password guessing
  - Password/key stealing
- **Back doors**
  - Often left by original developers as debug and/or diagnostic tools.
- **Trojan Horses**
  - Usually hidden inside of software that we download and install from the net.
  - Many install backdoors.

- **Software vulnerability exploitation**
  - Often advertised on the OEMs web site along with security patches.
  - Fertile ground for script kiddies looking for something to do.

Once inside, the hacker can…

- Modify logs
  - To cover their tracks.
- Steal files
  - Sometimes destroy after stealing.
  - An expert hacker would steal and cover their tracks to remain undetected.
- Modify files
  - To let you know they were there.
  - To cause mischief.
- Install back doors
  - So they can get in again.
- Attack other systems

The Role of Security and Penetration Testers

- Script kiddies or packet monkeys
  - Young or inexperienced hackers.
  - Copy codes and techniques from knowledgeable hackers.
- Experienced penetration testers write programs or scripts using
  - Perl, C, C++, Python, JavaScript, Visual Basic, SQL, and many others.

Penetration-Testing Methodologies

- **Tiger box**
  - Collection of OSs and hacking tools.
  - Usually on a laptop.
  - Helps penetration testers and security testers conduct vulnerabilities assessments and attacks.
- **White box model**
  - Tester is told everything about the network topology and technology.
  - Tester is authorized to interview IT personnel and company employees.
  - Makes tester's job a little easier.

- **Black box model**
  - Tester is not given details about the network.
  - Burden is on the tester to find the details.
- **Gray box model**
  - Hybrid of the white and black box models.
  - Company gives tester partial information.

What You Can Do Legally

- Laws involving technology change as rapidly as technology itself.
- Find what is legal for you locally.
  - Laws change from place to place.
- Be aware of what is allowed and what is not allowed.

Laws of the Land

- Tools on your computer might be illegal to possess.
- Contact local law enforcement agencies before installing hacking tools.
- Written words are open to interpretation.
- Governments are getting more serious about punishment for cybercrimes.

What You Cannot Do Legally

- Accessing a computer without permission is illegal.
- Other illegal actions:
  - Installing worms or viruses
  - Denial of Service attacks
  - Denying users access to network resources
- Be careful your actions do not prevent customers from doing their jobs.

Ethical Hacking in a Nutshell

- What it takes to be a security tester?
  - Knowledge of network and computer technology.
  - Ability to communicate with management and IT personnel.
  - Understanding of the laws.
  - Ability to use necessary tools.

In this course, we shall cover:

- Relevant networking technologies
- Basic cryptographic concepts
- Case studies of secure applications
- Unconventional attacks
- Tools demonstration

Topic

Lecture 2: Basic Concepts of Networking (Part I)

CONCEPTS COVERED

- Types of computer networks
- Circuit switching and packet switching
- Virtual circuits

Networking: Basic Concepts

- Computer Network
  - A communication system for connecting computers / hosts
- Why?
  - Better connectivity
  - Better communication
  - Better sharing of resources
  - Bring people together

Types of Computer Networks

- **Local Area Network (LAN)**
  - Connects hosts within a relatively small geographical area
    - ❖ Same room
    - ❖ Same building
    - ❖ Same campus
- **Wide Area Network (WAN)**
  - Hosts may be widely dispersed
    - ❖ Across campuses
    - ❖ Across cities / countries/ continents

Faster

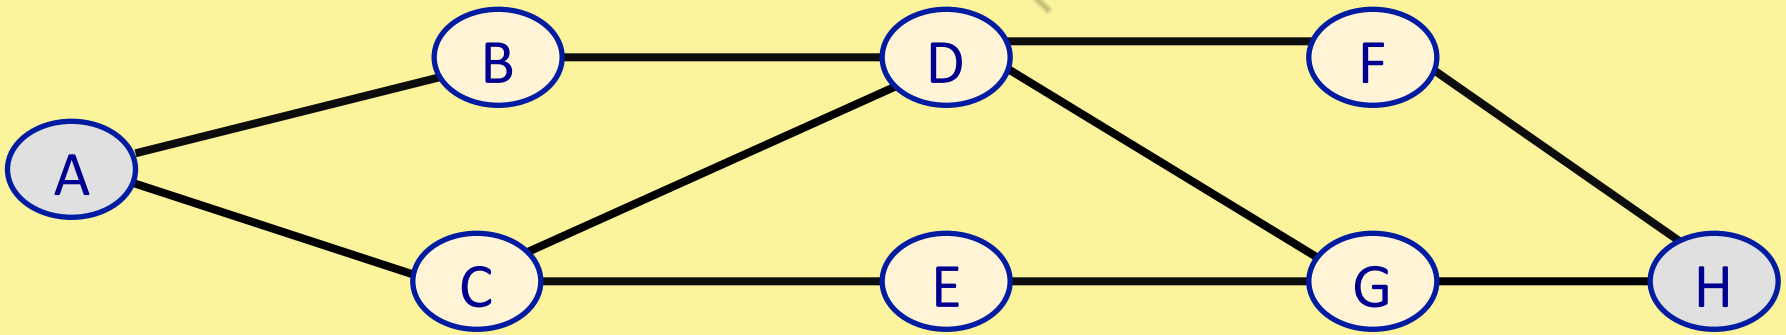
Cheaper

Slower

Expensive

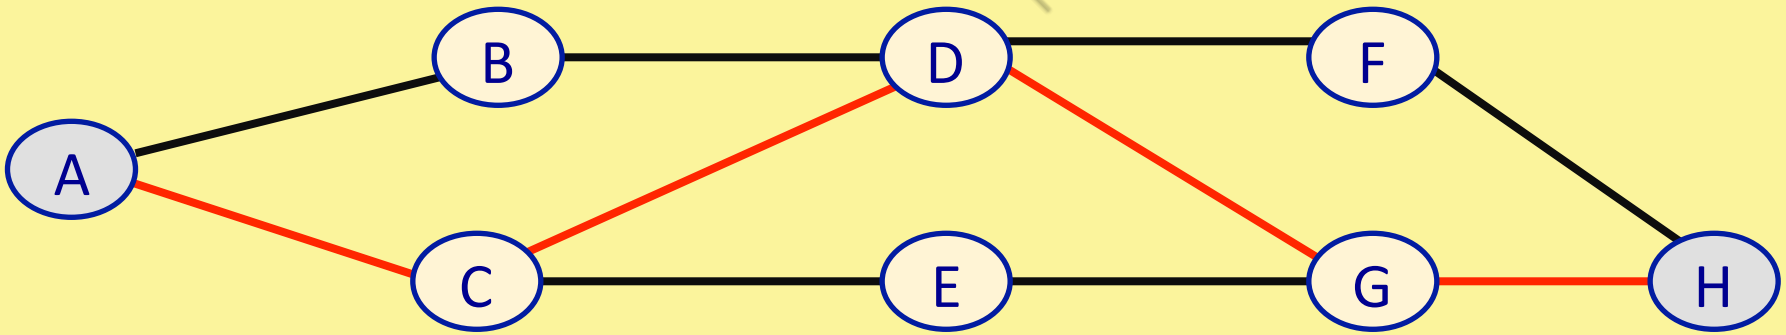
Data Communication over a Network

- Broadly two approaches:
  a) Circuit switching
  b) Packet switching



Circuit Switching

- A dedicated communication path is established between two stations.
  - The path follows a fixed sequence of intermediate links.
  - A logical channel gets defined on each physical link.
    - ❖ Dedicated to the connection.



Circuit Switching (contd.)

- Three steps are required for communication:

  a) **Connection establishment**
     - Required before data transmission.

  b) **Data transfer**
     - Can proceed at maximum speed.

  c) **Connection termination**
     - Required after data transmission is over.
     - For deallocation of network resources.

Circuit Switching (contd.)

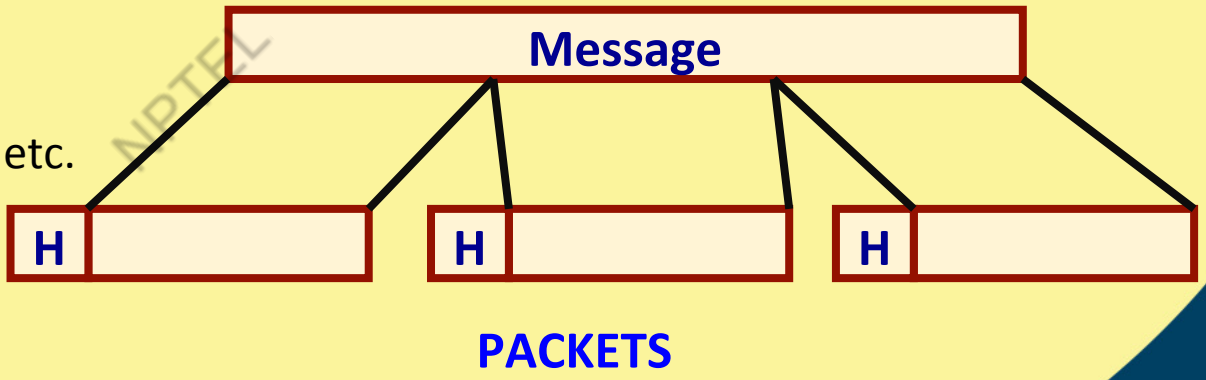
- Drawbacks:
  - Channel capacity is dedicated during the entire duration of communication.
    - ❖ Acceptable for voice communication.
    - ❖ Very inefficient for bursty traffic like data.
  - There is an initial delay.
    - ❖ For connection establishment.

Packet Switching

- Modern form of long-distance data communication.
  - Network resources are not dedicated.
  - A link can be shared.
- The basic technology has evolved over time.
  - Basic concept has remained the same.

Packet Switching (contd.)

- Data are transmitted in short packets (~ Kbytes).
  - A longer message is broken up into smaller *chunks*.
  - The chunks are called *packets*.
  - Every packet contains a *header*.
    - ❖ Relevant information for routing, etc.



Packet Switching (contd.)

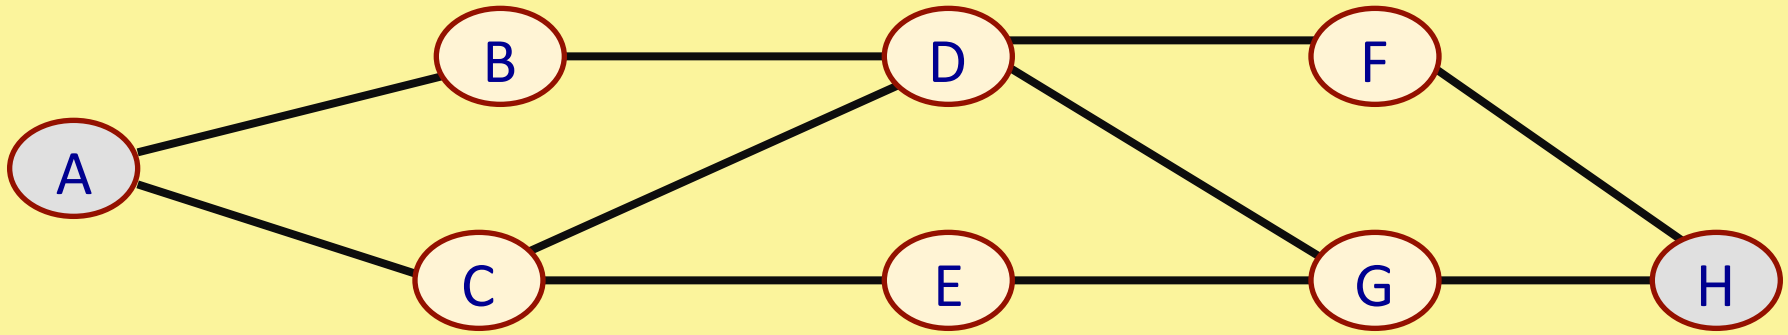
- Packet switching is based on store-and-forward concept.
  - Each intermediate network node receives a whole packet.
  - Decides the route.
  - Forwards the packet along the selected route.
- Each intermediate node (router) maintains a *routing table*.

Packet Switching (contd.)

- Advantages:
  - Links can be shared; so link utilization is better.
  - Suitable for computer-generated (bursty) traffic.
  - Buffering and data rate conversion can be performed easily.
  - Some packets may be given priority over others, if desired.

Packet Switching (contd.)

- How are packets transmitted?
  - Two alternative approaches:
    a) Virtual Circuits
    b) Datagram
- The abstract network model:



(a) Virtual Circuit Approach

- Similar in concept to circuit switching.
  - A route is established before packet transmission starts.
  - All packets follow the same path.
  - The links comprising the path are not dedicated.
    - ❖ Different from circuit switching in this respect.
- Analogy:
  - Telephone system.

(a) Virtual Circuit Approach (contd.)

- How it works?
  - Route is established a priori.
  - Packet forwarded from one node to the next using store-and-forward scheme.
  - Only the virtual circuit number need to be carried by a packet.
    - ❖ Each intermediate node maintains a table.
    - ❖ Created during route establishment.
    - ❖ Used for packet forwarding.
  - No dynamic routing decision is taken by the intermediate nodes.

Topic

Lecture 3: Basic Concepts of Networking (Part II)

CONCEPTS COVERED

- Datagrams
- Layered network architecture

(b) Datagram Approach

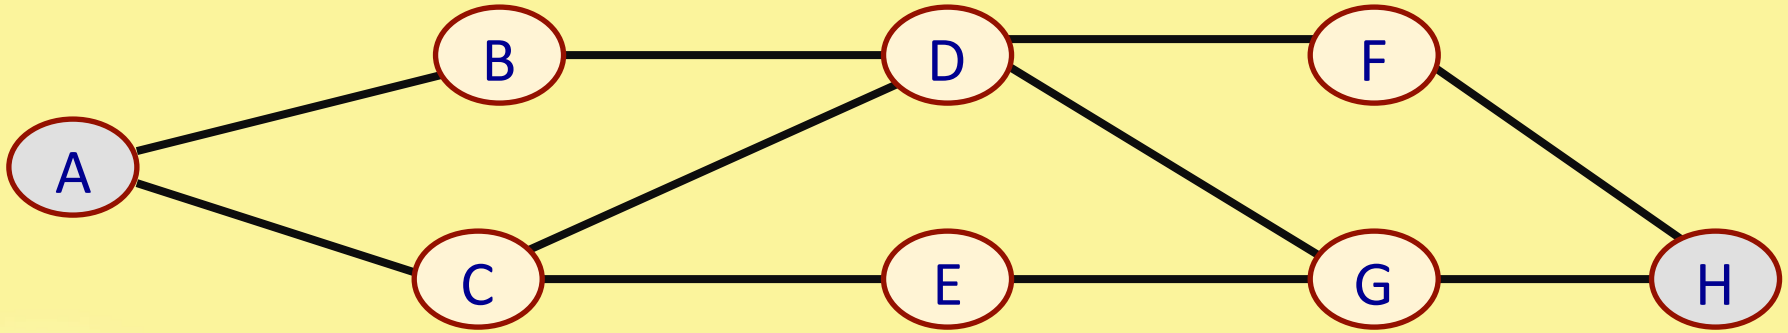
- Basic concept:
  - No route is established beforehand.
  - Each packet is transmitted as an independent entity.
  - Does not maintain any history.
- Analogy:
  - Postal system.

Datagram Approach (contd.)

- Every intermediate node has to take routing decisions dynamically.
  - Makes use of a *routing table*.
  - Every packet must contain *source and destination addresses*.
- Problems:
  - Packets may be delivered out of order.
  - If a node crashes momentarily, all of its queued packets are lost.
  - Duplicate packets may also be generated.

Datagram Approach (contd.)

- Advantages:
  - Faster than virtual circuit for smaller number of packets.
    - ❖ No route establishment and termination.
  - More flexible.
  - Packets between two hosts may follow different paths.
    - ❖ Can handle congestion/failed link.



Comparative Study

- Three types of delays must be considered:
  a) Propagation Delay
     - Time taken by a data signal to propagate from one node to the next.
  b) Transmission Time
     - Time taken to send out a packet by the transmitter.
  c) Processing Delay
     - Time taken by a node to process a packet.

Circuit Switching

- After initial circuit establishment, data bits sent continuously without any delay.

Virtual Circuit Packet Switching

- The *Call Request* packet sent from source to destination.
- The *Call Accept* packet returns back.
- Packets sent sequentially in a pipelined fashion.
  - Store-and-forward approach.

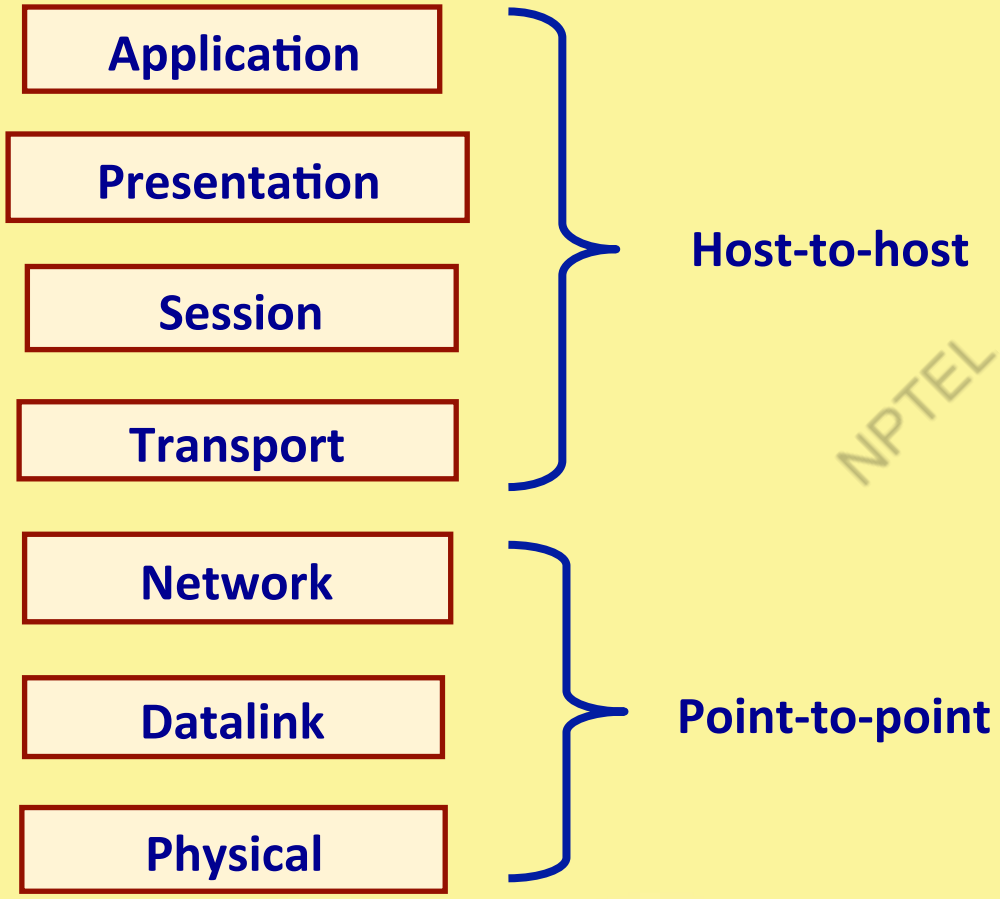
Datagram Packet Switching

- No initial delay.
- The packets are sent out independently.
  - May follow different paths.
  - Also follows store-and-forward approach.

Layered Network Architecture

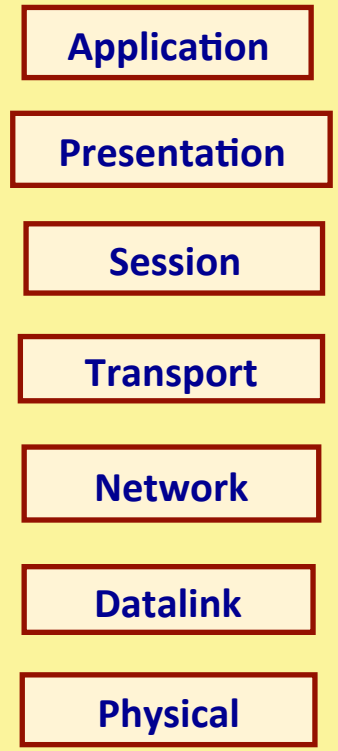
- Open systems interconnection (OSI) reference model.
  - Seven layer model.
  - Communication functions are partitioned into a hierarchical set of layers.
- Objective:
  - Systematic approach to design.
  - Changes in one layer should not require changes in other layers.

The 7-layer OSI Model



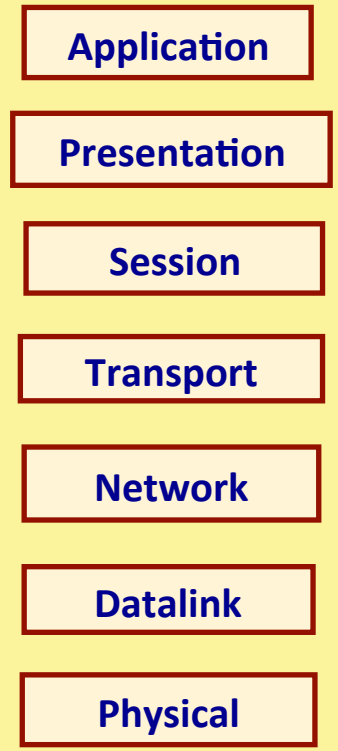
Layer Functions

- **Physical**
  - Transmit raw bit stream over a physical medium.
- **Data Link**
  - Reliable transfer of frames over a point-to-point link (flow control, error control).
- **Network**
  - Establishing, maintaining and terminating connections.
  - Routes packets through point-to-point links.

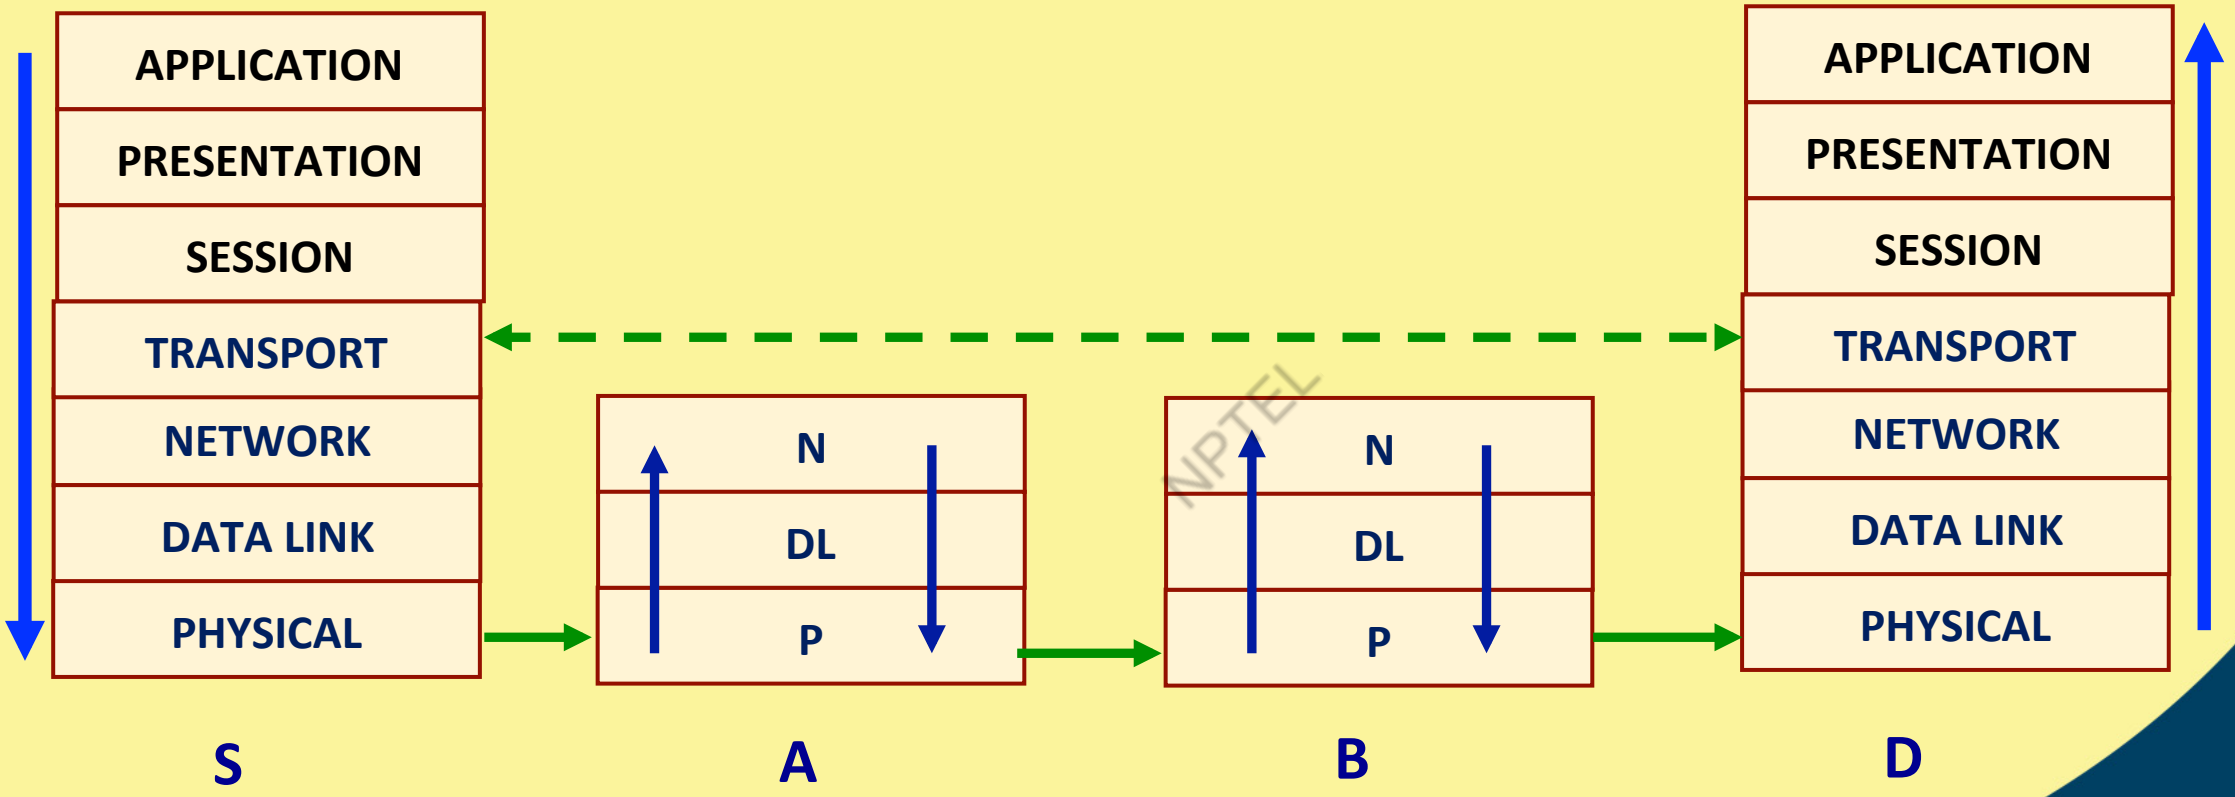


Layer Functions (contd.)

- **Transport**
  - End-to-end reliable data transfer, with error recovery and flow control.
- **Session**
  - Manages sessions.
- **Presentation**
  - Provides data independence.
- **Application**
  - Interface point for user applications.



How Data Flows



Internetworking Devices

- **Hub**
  - Extends the span of a single LAN.
- **Bridge / Layer-2 Switch**
  - Connects two or more LANs together.
  - Works at data link layer level.
- **Router / Layer-3 Switch**
  - Connects any combination of LANs and WANs.
  - Works at network layer level.

Typical Internetworking Structure

Topic

Lecture 4: TCP/IP Protocol Stack (Part I)

CONCEPTS COVERED

- TCP/IP protocol stack
- Basic functions of TCP, UDP and IP
- Data encapsulation

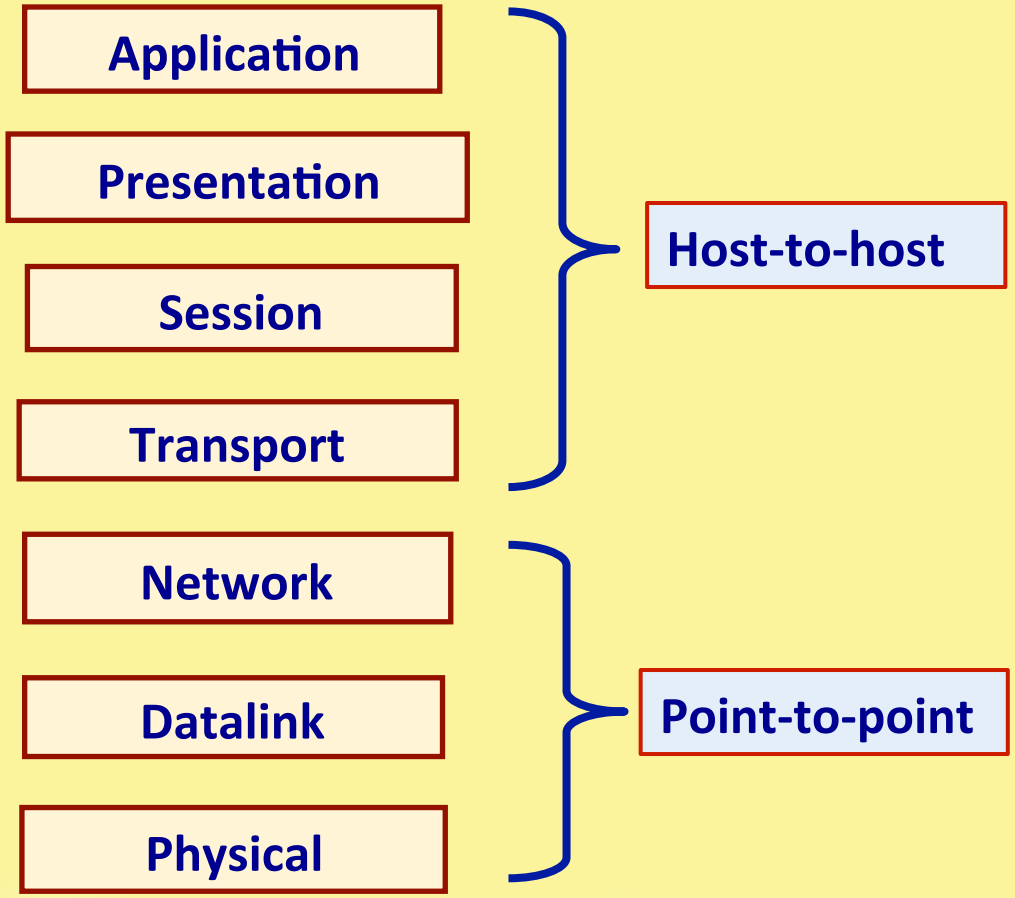
Introduction

- TCP/IP is the most fundamental protocol used in the Internet.
  - Allows computers to communicate / share resources.
  - Used as a standard.
  - To bridge the gap between non-compatible platforms.
- Work on TCP/IP started in the 1970s.
  - Funded by US Military.
  - Advanced Research Project Agency (ARPA).

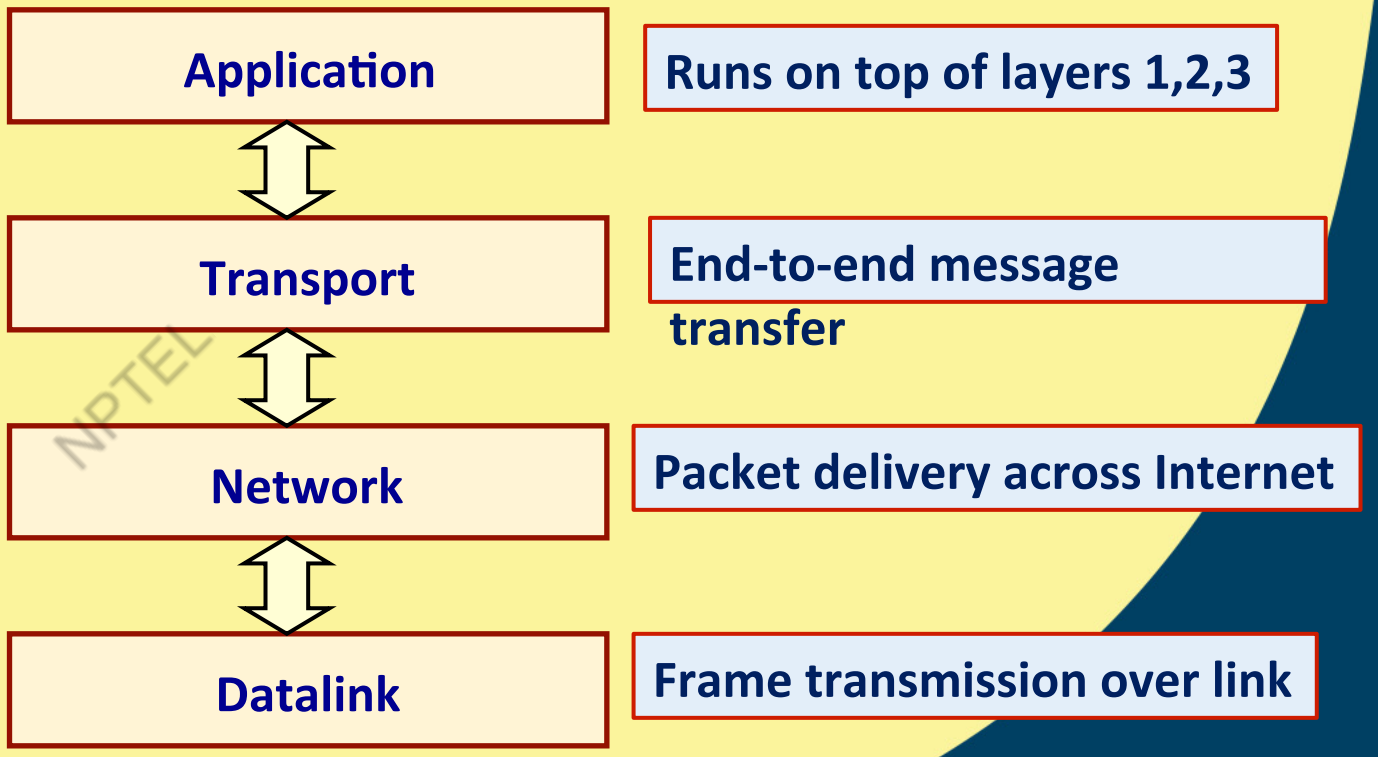
Network Layering in TCP/IP

- In 1978, International Standards Organization (ISO) proposed the 7-layer OSI reference model for network services and protocols.
  - TCP/IP does not strictly follow the OSI model.
  - It follows a simplified 4-layer model.

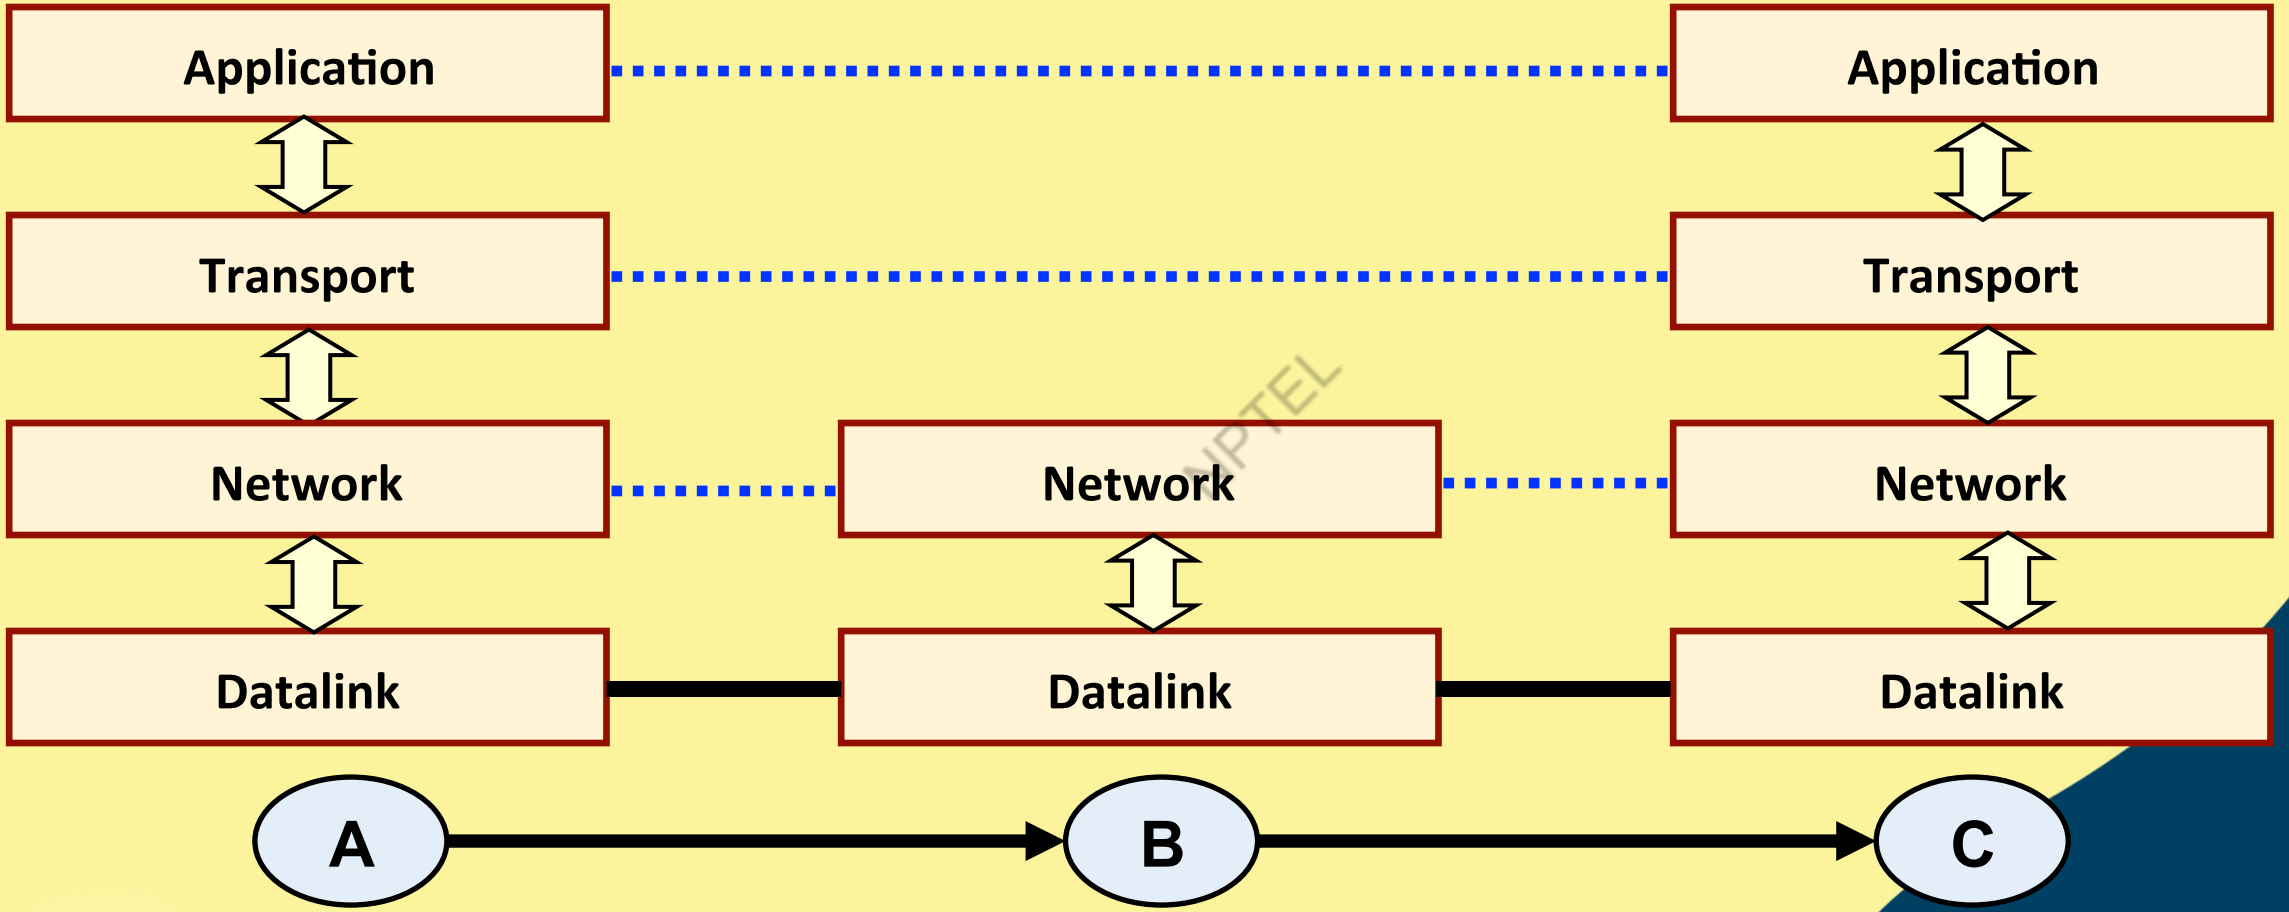
The 7-layer OSI Model



The 4-layer TCP/IP Model



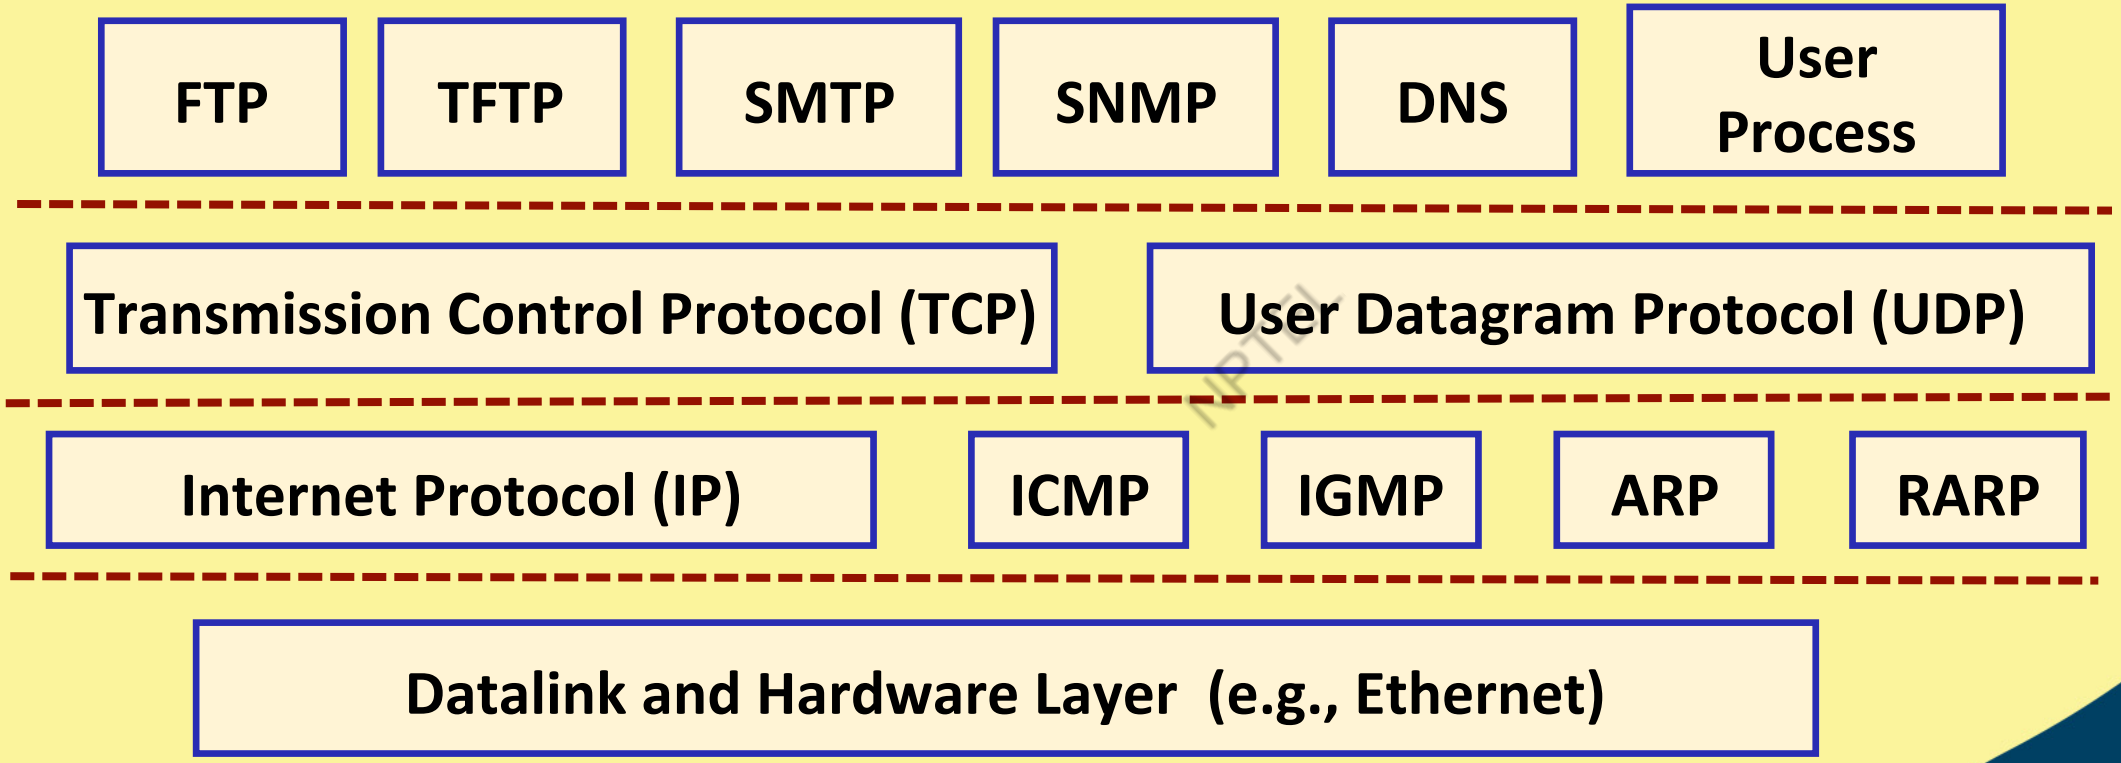
Data Flow in 4-layer Model



TCP/IP Protocol Suite

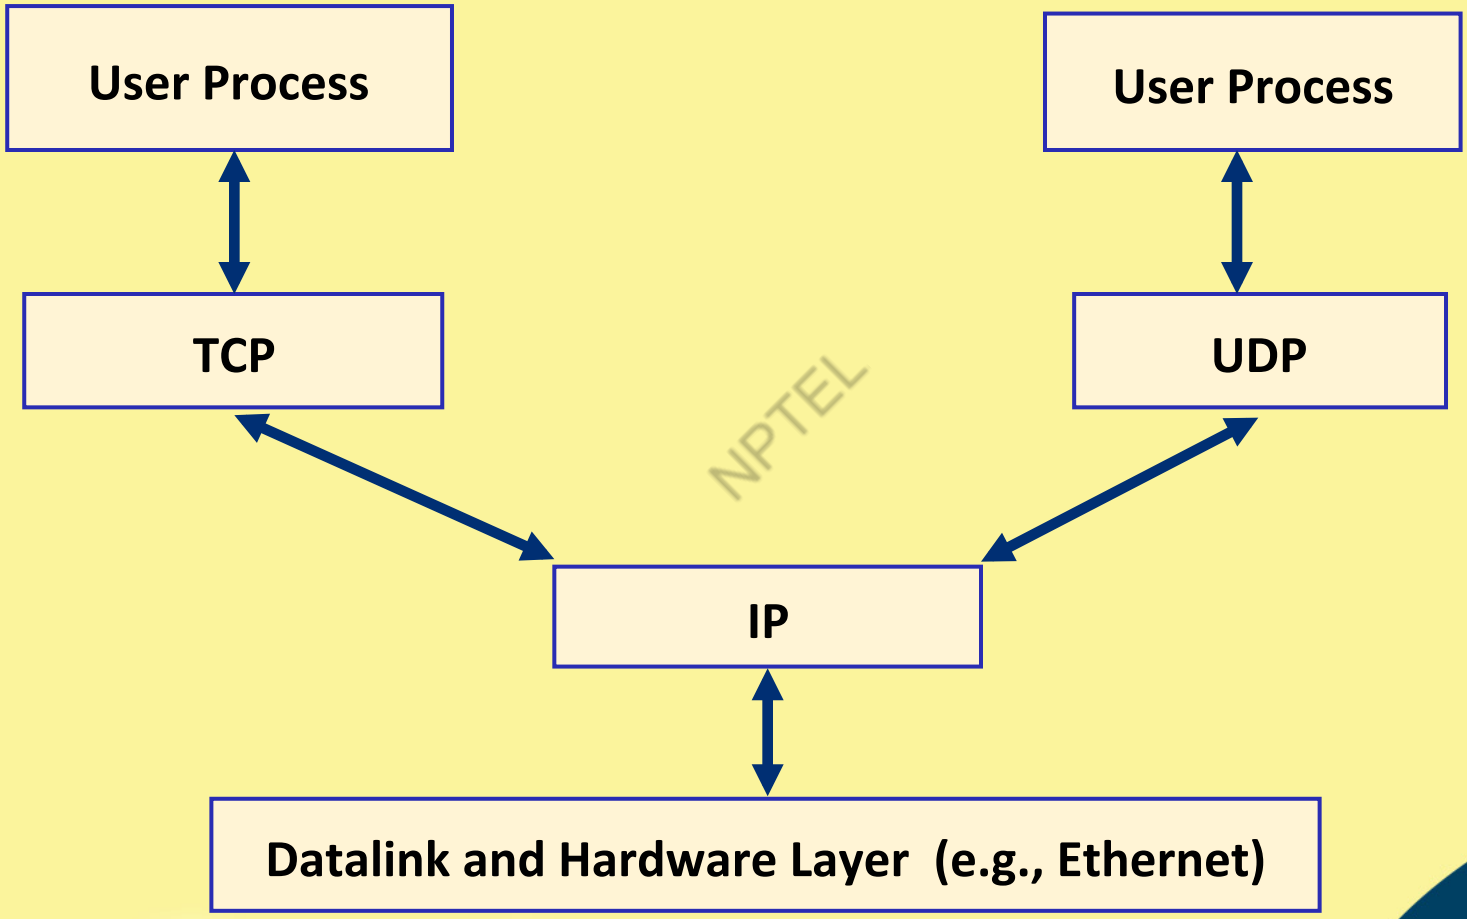
- Refers to a family of protocols.
- The protocols are built on top of connectionless technology (*datagrams*).
  - Data sent from one node to another as a sequence of datagrams.
  - Each datagram is sent independently.
  - The datagrams corresponding to the same message may follow different routes.
    - ❖ Variable delay, arrival order at destination.

TCP/IP Family Members (Partial List)



- **Address Resolution Protocol (ARP)**
  - Map IP addresses to hardware (MAC) addresses.
- **Reverse Address Resolution Protocol (RARP)**
  - Map hardware addresses to IP addresses.
- **Internet Control Message Protocol (ICMP)**
  - A network device can send error messages and other information.
- **Internet Group Management Protocol (IGMP)**
  - A node can send its multicast group membership to adjacent routers.

Typical Scenario



What does IP do?

- IP transports datagrams (packets) from a source node to a destination node.
  - Responsible for routing the packets.
  - Breaks a packet into smaller packets, if required.
  - Unreliable service.
    - ❖ A packet may be lost in transit.
    - ❖ Packets may arrive out of order.
    - ❖ Duplicate packets may be generated.

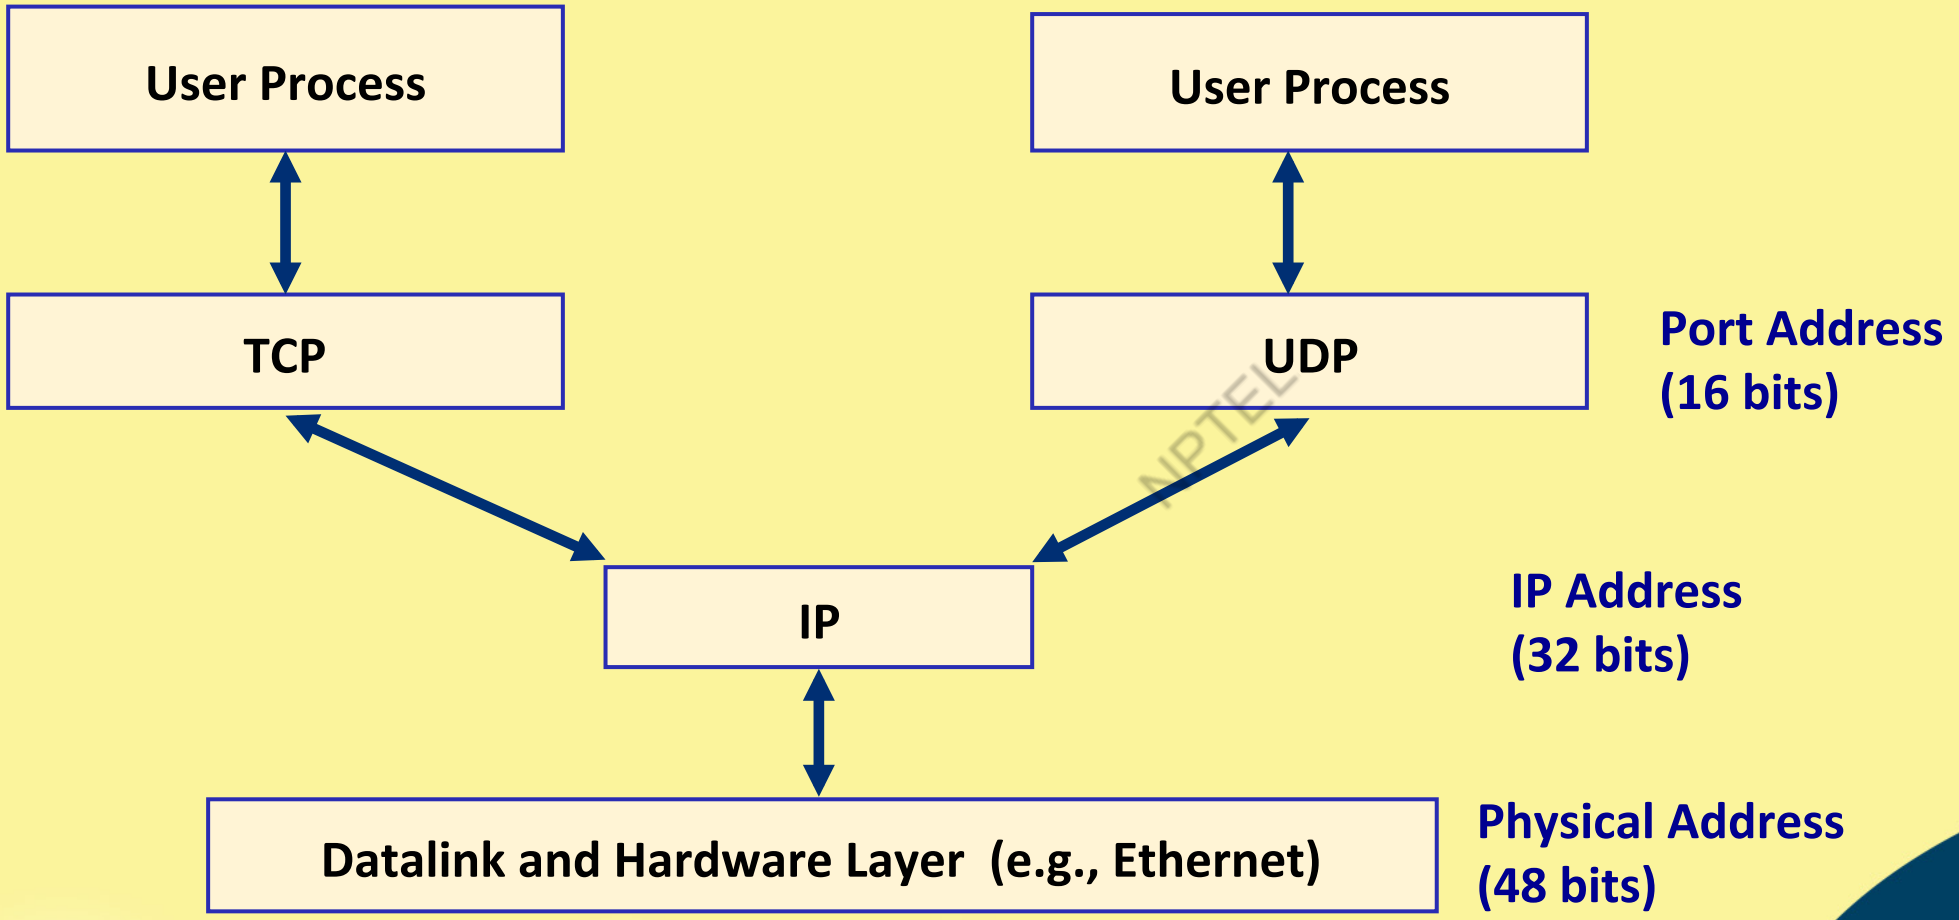
What does TCP do?

- TCP provides a connection-oriented, reliable service for sending messages.
  - Split a message into packets.
  - Reassemble packets at destination.
  - Resend packets that were lost in transit.
- Interface with IP:
  - Each packet forwarded to IP for delivery.
  - Error control is done by TCP.

What does UDP do?

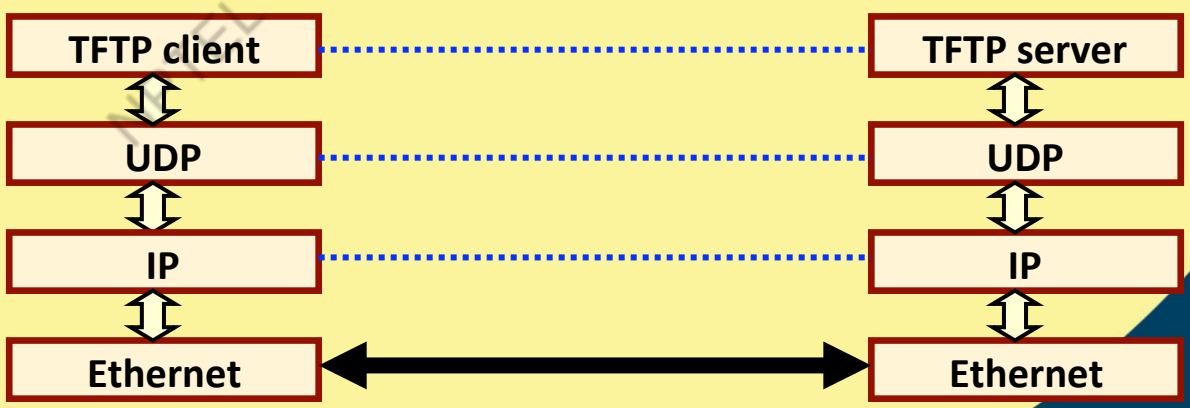
- UDP provides a connectionless, unreliable service for sending datagrams (packets).
  - Messages small enough to fit in a packet (e.g., DNS query).
  - Simpler (and faster) than TCP.
  - Never split data into multiple packets.
  - Does not care about error control.
- Interface with IP:
  - Each UDP packet sent to IP for delivery.

Addresses in TCP/IP



Encapsulation

- Basic concept:
  - As data flows down the protocol hierarchy, headers (and trailers) get appended to it.
  - As data moves up the hierarchy, headers (and trailers) get stripped off.
- An example to illustrate:
  - Trivial file transfer protocol (TFTP).
  - TFTP client transfers 200 bytes of data.
  - 4 bytes of TFTP header gets added.



Encapsulation in TFTP

Department : Computer Science and Engineering

Topic

Lecture 5: TCP/IP Protocol Stack (Part II)

CONCEPTS COVERED

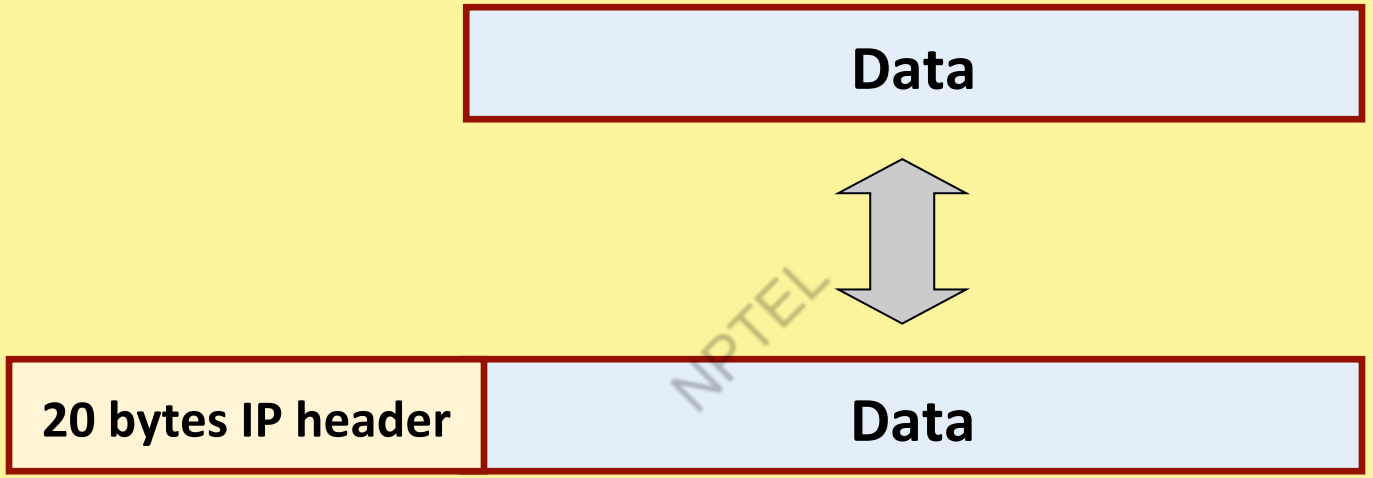
- IP Datagrams
- IP Header fields

IP Datagrams

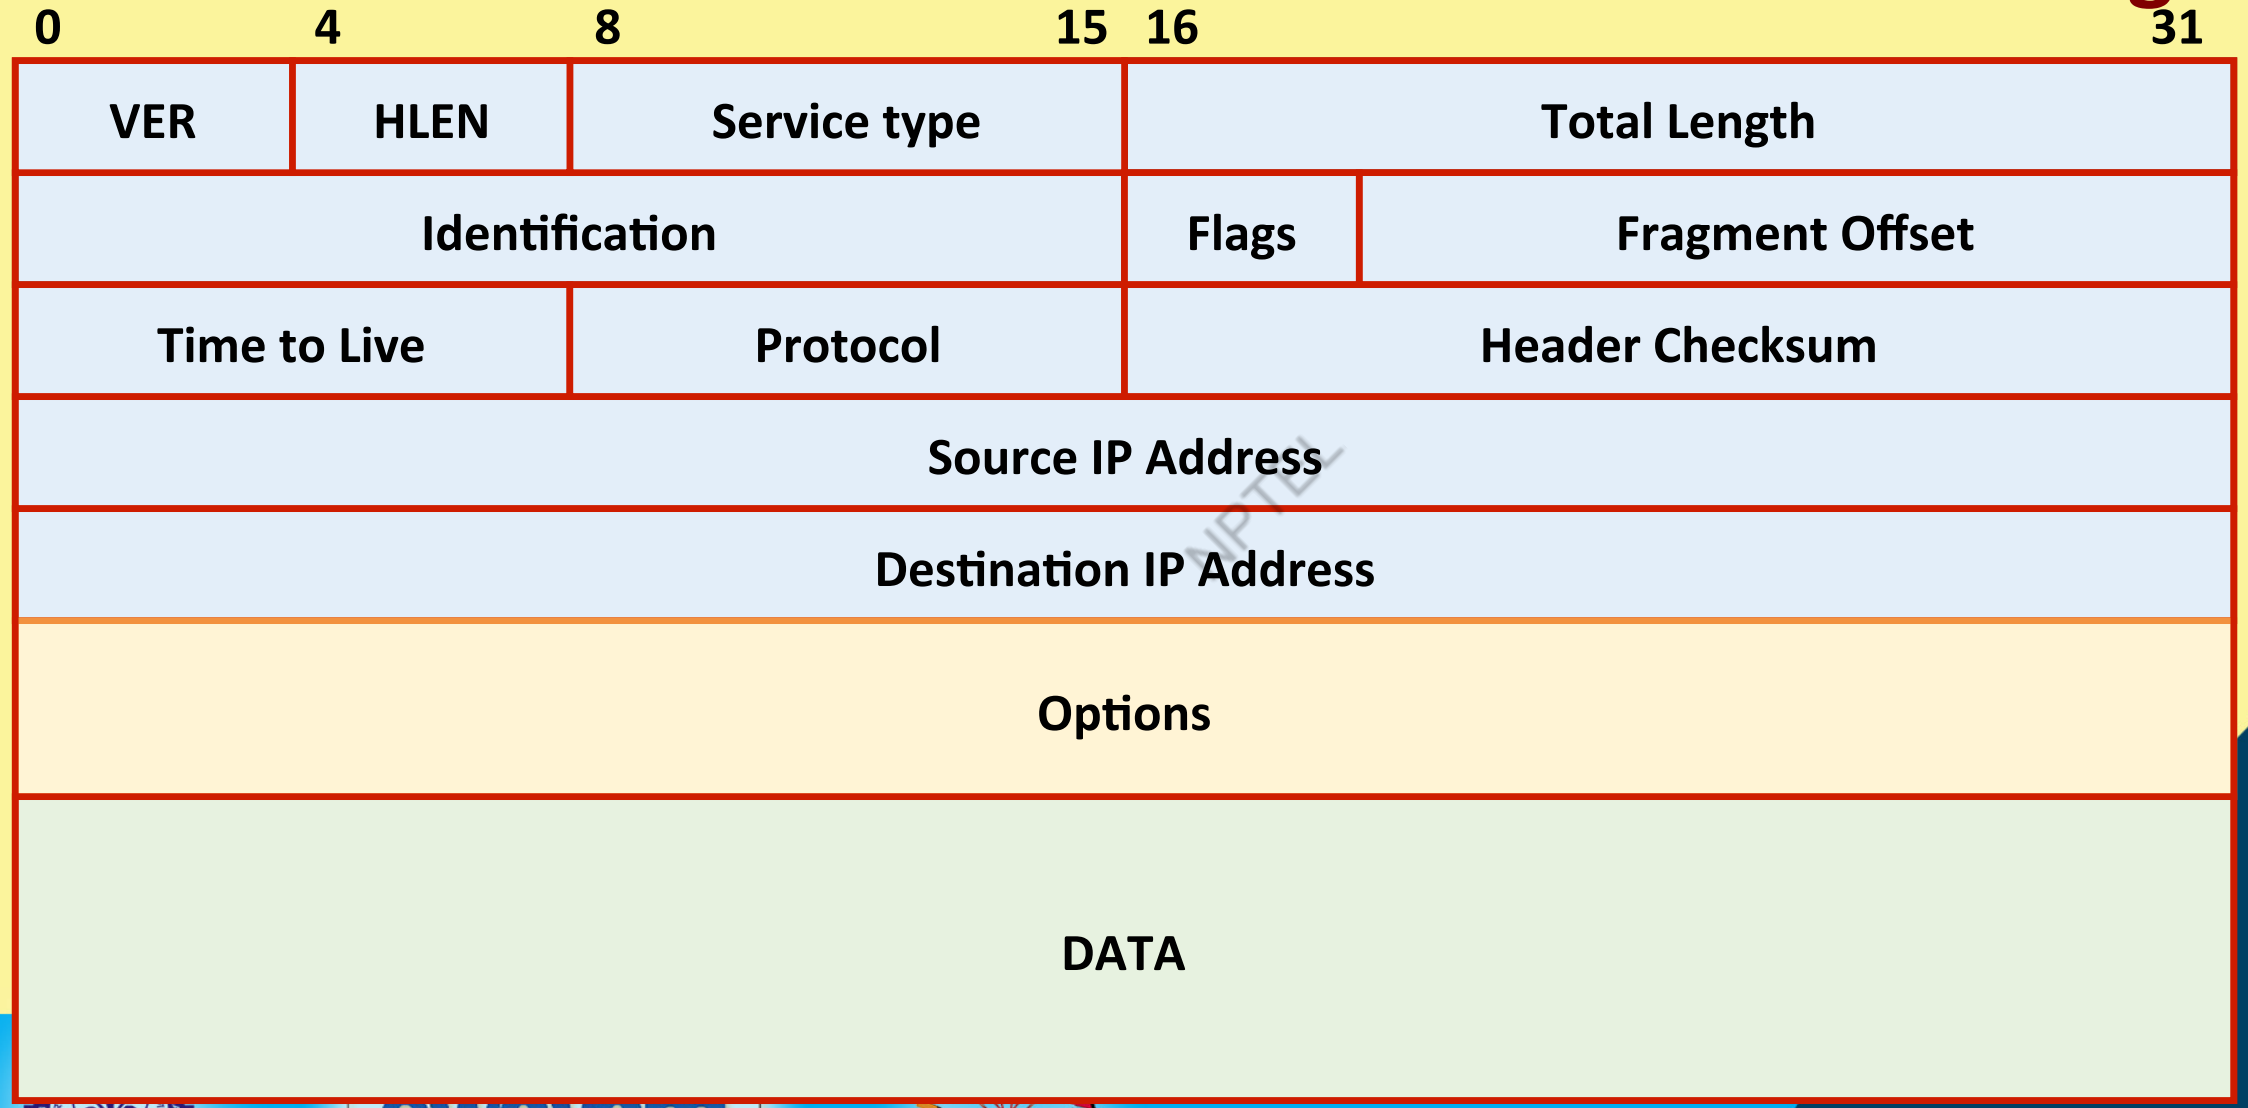
The IP Layer

- IP layer provides a connectionless, unreliable delivery system for packets.
- Each packet is independent of one another.
  - IP layer need not maintain any history.
  - Each IP packet must contain the source and destination addresses.
  - IP layer does not guarantee delivery of packets.
- IP layer encapsulation
  - Receives a data chunk from the higher layer (TCP or UDP).
  - Prepends a header of minimum 20 bytes.
    - ❖ Containing relevant information for handling routing and flow control.

Illustration



Format of IP Datagram



IP Header Fields

- **VER (4 bits)**
  - Version of the IP protocol in use (typically 4).
- **HLEN (4 bits)**
  - Length of the header, expressed as the number of 32-bit words.
  - Minimum size is 5, and maximum 15.
- **Total Length (16 bits)**
  - Length in bytes of the datagram, including headers.
  - Maximum datagram size :: 2^{16} = 65536 bytes.

IP Header Fields (contd.)

- **Service Type (8 bits)**
  - Allows packet to be assigned a priority.
  - Router can use this field to route packets.
- **Time to Live (8 bits)**
  - Prevents a packet from traveling in a loop.
  - Senders sets a value, that is decremented at each hop. If it reaches zero, packet is discarded.
- **Protocol (8 bits)**
  - Identifies the higher layer protocol being used.

IP Header Fields (contd.)

- **Source IP address (32 bits)**
  - Internet address of the sender.
- **Destination IP address (32 bits)**
  - Internet address of the destination.
- **Identification, Flags, Fragment Offset**
  - Used for handling fragmentation.
- **Options (variable width)**
  - Can be given provided router supports.
  - Source routing, for example.

IP Header Fields (contd.)

- **Header Checksum (16 bits)**
  - Covers only the IP header.
  - How computed?
    - ❖ Header treated as a sequence of 16-bit integers.
    - ❖ The integers are all added using ones complement arithmetic.
    - ❖ Ones complement of the final sum is taken as the checksum.
  - A mismatch in checksum causes the datagram to be discarded.

Viewing IP Packets

- We can use ***packet sniffers*** to view IP packets.
- Some popular packet sniffers:
  - Wireshark
  - Windump
  - tcpdump
  - Tshark
  - SolarWinds
  - …. and many more

Wireshark …
